

Chapter VI

Intelligence and Creation

The Era of the Mental Body

CHAPTER VI

Intellect and Creation

The Era of the Mental Body

After the transition symbolically associated in this book with Noah and the Great Flood, a new space of development opened before the Human.

The Physical Body allowed him to exist in the material world. The Etheric sustained life. The Astral opened the immense world of feelings. Now the Mental Body was added to this system.

The Human had to learn not only to live and feel.

He had to learn to think.

But the Mental Body brought more than the ability to reflect. It opened a quality that gradually changed the entire face of Earth — the ability to create within consciousness an image of what does not yet exist and then embody that image in the material world.

The Mental Body became the Body of Creation.

The Birth of Intellect

The principal instrument of the Mental Body is Intellect.

Intellect receives information, preserves it, compares facts, discovers patterns, analyzes possible alternatives, and proposes solutions.

It is capable of processing enormous volumes of accumulated experience.

It compares.

Calculates.

Classifies.

Models.

Predicts probable consequences.

But Intellect is not the source of information itself.

This is fundamentally important.

High intelligence does not mean that a person automatically knows more than others or receives knowledge from an unknown source. It means, above all, the ability to work quickly and in complex ways with what has already become available to consciousness.

Intellect is the ability to process information, analyze it, and find possible solutions. It is rationality.

From Adaptation to Transformation

Before the development of the Mental Body, the Human predominantly adapted to the world.

If it was cold, he sought shelter.

If a predator was nearby, he avoided danger.

If food ran out, he moved to where there was more of it.

But gradually an entirely new principle emerges.

The Human no longer merely changes his behavior in accordance with the environment.

He begins to change the environment in accordance with an image that has arisen in his consciousness.

Stone becomes a tool.

Wood — a dwelling.

Clay — a vessel.

Fire — an instrument.

Ore — metal.

Metal — a plow, a weapon, a mechanism.

Nature ceases to be merely a habitat.

It becomes the material of Creation. The Human no longer merely obtains food — he produces it.

Earth — the Human's First Workshop

Here it is especially important to understand the role of Earth itself.

In the system of this book, Earth is not a lifeless storehouse of resources created for endless consumption.

It is a living entity and a direct participant in the Plan of Creation.

Like a mother who allows a child to discover the world through touch, movement, and personal experience, Earth as a living entity allows the Human to discover the properties of matter through itself.

It gives stone.

Wood.

Clay.

Ore.

Metals.

Water.

Fire.

Sources of energy.

Every material becomes a new lesson.

The Human learns hardness and plasticity, heat and cold, conductivity and resistance, density and lightness, the capacity of matter to combine, break apart, and assume a new form.

Earth becomes the Human's first workshop.

It allows him to experiment with its own matter so that the Mental Body may learn not only to perceive what the Creator has made, but also to continue the process of creating new forms.

The Body of Creation

This is precisely why the Mental Body cannot be reduced to logic.

If its task were only calculation, human civilization would look entirely different.

The Human is capable of seeing within himself what does not yet exist in the external world.

A house before it is built.

A bridge before it joins two shores.

A melody before it sounds.

A painting before paint touches canvas.

A mechanism before its parts are made.

A theory before it receives its final form.

Thus the Mental Body becomes the space in which an image of the future can appear before its material embodiment.

The Human first creates within himself what does not yet exist and then invites matter to assume the form of his design.

From a Stone Tool to a Spacecraft

The entire history of material civilization can be read as the development of this capacity.

The first worked tool was already more than a stone found in nature.

Nature created the stone.

But the Human created the form of the tool.

Thus began an immense journey.

From the stone hand axe — to metal.

From metal — to mechanism.
From mechanism — to machine.
From machine — to the most complex technical systems.
From observing the sky — to the spacecraft.
Every new stage begins in the same way.
First an image appears.
Then Intellect tries to understand how that image can be embodied.
It searches for material.
Calculates.
Corrects errors.
Creates alternatives.
And finally the inner image becomes part of physical reality.

The Image Before Understanding

But human creativity reveals another feature.

Not every new image arises as the result of sequential rational reasoning.

Sometimes a person first sees the solution and only afterward tries to understand why it is correct.

Sometimes an unexpected connection appears between phenomena that previously seemed unrelated.

Sometimes a complete image arises before there is language capable of explaining it.

Sometimes the Human first sees what he does not yet understand and only then begins to seek a language capable of explaining what he has seen.

And here it is necessary to distinguish Intellect from Intuition.

Intellect and Intuition

The rational process has a clear sequence.

Information → analysis → alternatives → solution.

The intuitive creative process may proceed differently.

Image → perception → attempt to understand → intellectual processing → embodiment.

Intuition does not have to be rational or logical.

It can provide direction before Intellect is capable of justifying it.

This does not make Intellect unnecessary.

On the contrary.

Without intellectual processing, the received image may remain only an image.

Intellect tests it, translates it into concepts, compares it with what is known, and searches for a way to embody it.

Therefore Intuition and Intellect perform different functions.

Intuition can reveal an image. Intellect helps turn it into form.

The Information Field

Where do images come from that a person cannot derive from a sequential chain of reasoning?

There are different answers to this question.

Psychology may speak of the work of the unconscious, accumulated experience, hidden information processing, and sudden insight.

The history of science and art contains many accounts of solutions appearing unexpectedly — in dreams, at rest, during a walk, or at a moment when conscious work on a problem had ceased.

In the metaphysical system of this book there is another hypothesis.

Consciousness may be capable of perceiving information that is not generated directly within a sequential rational process.

Conventionally, such a space may be called an information field.

This does not mean that every sudden image necessarily comes from outside. Still less does it mean that a person should abandon verification of what has been received.

But the very possibility of such perception helps explain an important distinction:

Intellect does not necessarily create the primary image. Sometimes its task is to recognize, understand, and embody what has already appeared in consciousness.

The Human Continues Creation

When the Human transforms matter in accordance with an inner image, he begins to perform an entirely new function.

He does not create matter out of nothing.

He uses what already exists in the world.

But he is capable of combining what exists in a way that did not previously occur in nature.

Nature does not create a violin.

It does not create a cathedral.

It does not create a book.

It does not create a mathematical formula written in human language.

It does not create a spacecraft.

All the materials for them already existed.

But their new organization appeared through human consciousness.

In this sense, creativity becomes a continuation of the act of Creation within the material world.

The Creator creates possibility. The Soul, in absolute Freedom, chooses the experience it needs; the Karmic Council forms the eventfulness; and the incarnate Human lives through it without knowing the scenario. Within this eventfulness, Intellect becomes an instrument through which a design acquires material form.

The Freedom of Creation

But together with the capacity to create comes a new responsibility.

The same metal can become a plow or a sword.

The same energy can warm a home or destroy it.

The same knowledge can heal a person or cause harm.

Intellect is capable of creating either alternative.

Because Intellect by itself does not determine the purpose.

It answers the question:

How?

How to build.

How to obtain.

How to win.

How to increase.

How to accelerate.

How to acquire.

But there is another question:

Should this be done?

And this question already begins to move beyond Intellect alone.

When Intellect Serves the Astral Body

A new body does not destroy the previous ones.

The Mental Body comes to a Human who already possesses the Astral Body.

Therefore Intellect can become the servant of feelings.

If fear governs a person, Intellect creates increasingly complex systems of protection.

If greed governs him, Intellect finds increasingly effective ways to accumulate.

If hatred governs him, Intellect creates more sophisticated weapons.

If the desire for power governs him, Intellect develops more complex methods of controlling another person.

Here it becomes obvious why high intelligence by itself is not a sign of a high state of consciousness.

Intellect amplifies the state it serves.

A harmonized feeling receives in it an instrument of creation.

An unharmonized passion — an instrument of destruction.

The Civilization of Intellect

Nevertheless, it was the Mental Body that created civilization in the form in which we know it.

Writing appeared.

Mathematics.

Philosophy.

Science.

Architecture.

Law.

Complex forms of art.

Engineering.

Medicine.

Technology.

Knowledge ceased to disappear with the death of one person.

It became possible to record it, transmit it, test it, and add to it.

Each new generation gained the possibility of beginning not from zero, but from the accumulated experience of those before it.

Thus development accelerated.

Thousands of individual human intellects began to connect through language, writing, education, and culture into an immense system of accumulated knowledge.

The Human transformed the surface of Earth.

But with this, a new problem became increasingly visible.

The capacity to transform grew faster than the capacity to understand the consequences of transformation and the time required to restore the natural resources consumed.

The Mother Continues to Give

Earth continued to give the Human material for creation.

He entered ever deeper into her body.

He extracted ore.

Coal.

Oil.

Gas.

Rare metals.

Used rivers.

Forests.

Fertile lands.

Later he learned to use atomic energy.

Each new resource expanded the possibilities of civilization.

And each time Intellect asked first of all:

What else can we do?

But the relationship between child and mother cannot forever remain a relationship of receiving alone.

A mother gives a child everything necessary for growth.

But growing up presupposes a moment when the child begins to understand the price of what has been given.

So humanity, too, gradually had to move from the ability to take from Earth and transform her toward understanding the consequences of its own creativity.

Intellect taught the Human to take from Earth and transform her. Reason must teach him to understand the consequences of that transformation.

“Can” and “Should”

In this distinction appears the boundary between two ages.

Intellect asks:

Can I?

Reason asks:

Should I?

Intellect can calculate benefit.

Reason must see the price.

Intellect can find a way to achieve a goal.

Reason must ask what trace that goal will leave in the Human himself and in the world.

Intellect can create power.

Reason must learn not to turn power into domination over another.

Thus humanity gradually approaches a new quality.

Intellect and Reason

In everyday speech these concepts are often confused.

But in the system of this book a fundamental boundary lies between them.

Intellect belongs primarily to the Mental Body.

It works with information.

Reason is connected with the future Causal state.

It matures through lived experience.

One can know about the consequences of another person's action.

But knowledge does not yet become Reason. Only lived causality — one's own action, its consequences, and accepted responsibility — transforms knowledge into experience.

One can read thousands of books about love.

But knowledge about love cannot replace the experience of love.

One can study forgiveness as a moral category.

But the Human begins to understand its depth when he himself lives through a situation in which pain, forgiveness, consequences, and responsibility cease to be abstract concepts and become his own experience.

Intellect is born from knowledge. Reason matures through experience.

How Experience Becomes Reason

The path from feeling to Reason passes through a sequence that cannot be replaced by education alone.

**Eventfulness → Experience of the moment → Action → Consequence
→ Responsibility → Experience → Harmonization.**

The Human enters an eventfulness whose scenario is unknown to him and experiences the state that arises.

He does not know in advance either the entire sequence of events or their place within the experience chosen by the Soul.

He acts from the state of consciousness he is capable of accommodating at that moment.

The action becomes part of the causality being lived.

Then the Human encounters the consequences of what has occurred.

And it is here that responsibility arises: not as knowledge of a hidden scenario, but as the necessity to live through and comprehend the causality of one's own action.

If responsibility can be accommodated and understood, what has been lived becomes experience.

If experience is understood, it is capable of changing the Human's inner state.

Thus the lower levels are gradually harmonized.

And it is precisely this harmonization that creates readiness for the next body.

Why a High IQ Is Not Enough

Humanity has become accustomed to admiring intelligence.

And this is natural.

The Mental Body created virtually all complex civilization.

But a high IQ does not mean a high degree of inner harmony.

A person can be a brilliant mathematician and remain a slave to jealousy.

He can create outstanding technologies and be completely dependent on the thirst for power.

He can understand the most complex laws of nature and fail to understand himself.

Therefore the Causal Body cannot be attained through Intellect alone.

Accumulating knowledge is not enough.

The preceding human vertical must be prepared for higher energy.

It is not IQ that prepares the Human for the Causal level. The entire preceding vertical must be harmonized.

Those Who Go Ahead

But humanity never develops with complete uniformity.

Even within one age there are people who are far ahead of the average state of civilization.

They are capable of feeling what the majority is only beginning to discover.

Seeing causal connections that remain inaccessible to others.

Living from a state that seems almost impossible to those around them.

Such people become points of orientation.

Sometimes philosophers.

Sometimes prophets.

Sometimes Teachers.

They do not abolish humanity's common path and do not make others less valuable.

They show the direction of the next movement.

And when the Mental age had reached sufficient maturity, a new question had to arise before the Human.

Not how to create more.

Not how to know more.

Not how to become stronger.

But how to learn to use knowledge and power rightly. Not to possess them for possession's sake, but to understand the consequences of their application.

The answer to this question could not be given by a single new technology.

For it, humanity needed Teachers.

The Mental Body taught the Human to create. The next step had to teach him to answer for what he had created.
